1. tarGET-X as search broker

Since the first version of tarGET-X I had different search services here. That have been always a couple of different scripts (javascript, CGI, ...). It was hard to maintain for me, so I just started the work on a search broker as forrest plugin.

2. How does it work?

On this page you find a second search form. The particularity on this form is that by default it will add the redirect link to a history list instead of actually doing the redirect.
